                                                                                                                                                                                                                                                                                                          /note-"vector: pBluescript SK(-); Site_1: NotI; Site_2:
ECORI; mRNA was purified from the mouse Ltk- fibroblastoid
cultured cells. Double-stranded cDNAs were synthesized
from the mRNA using an ollgo(dT) NotI primer. After
shearing to 200-400 bp, a synthetic linker-primer, which
has one blunt and one sticky end and an internal EcoRI
site, was ligated to the cDNAs. The cDNAs were amplified
by the polymerase chain reaction (PCR) using the ligated
linker-primer sequence. After denaturation and
reassociation of the ds-cDNAs, and isolation of single-
stranded cDNAs by hydroxyapatite chromatography, the
single- stranded cDNAs were again amplified by PCR. The
cDNAs were digested with EcoRI and NotI, and inserted
into a plasmid vector."

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       modified polylinker; 1st strand cDNA was prepared from neuroendocrine lung carcinoid, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library was constructed by Bento Soares and M. Fatima Bonaldo. " a 34 c 21 g 22 t

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          dchak@pegasus.cc.ucf.edu
                                                                                                                                                                                                                                                                                                                                                                                              using an oligo dT-Xho I primer. Second strand was prepared using RNase H and DNA polymerase I. EcoR I adapters were ligated to the cDNA, and it was digested with Xho I. Prepared fragments were ligated into EcoR I Xho I digested lambda ZAP II vector. "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        S
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 DR Detection of polymorphic genetic markers of the form PT (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers PT (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers PT (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers PT (dC-dA)n(dG-dT)n + using novel nucleic acid mols. as primers PT (dC-dA)n. (dG-dT)n which can be used as genetic CC the invention relates to the isolation of polymorphic repeat sequences CC markers. Primers based on these sequences can be used to detect these CC commercial animal or plant breeding or paternity or maternity testing. CC containing the repeat sequences were isolated by hybridisation of CC chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) CC composed the contained are shown in T65704-797. This repeat CC were amplified by primers T65798-T66047. Those clones where the repeat CC sequence has been determined are shown in T65704-797. This repeat CC sequence is from the formula: (TC)12.5GTT(TC)11.5(CA)14A(CA)5.5.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Query Match

Detection of polymorphic genetic markers of the form (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers Example 8; Column 57-58; 186pp; English.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n. (dG-dT)n which can be used to detect these markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis.

The repeats, when analysed, fall into 4 categories:

1) perfect repeats which are alternating tandem CA repeats with no interruptions and without adjacent repeats of another sequence;

2) imperfect repeats which are defined as 2 or more runs of uninterrupted
                                                                                                                                                                                                                                                                                                                                                                                                  Homo sapiens.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            맑
problements of the form primers (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers Claim 1; Column 9-10; 186pp; English.

Claim 1; Column 9-10; 186pp; English.

The invention relates to the isolation of polymorphic repeat sequences having the sequence (dC-dA)n.(dG-dT)n which can be used as genetic markers. Primers based on these sequences can be used to detect these repeats, especially for use in e.g paternity or maternity testing, human genetic analysis such as linkage analysis of genetic disease, commercial animal or plant breeding or pedigree analysis. Clones containing the repeat sequences were isolated by hybridisation of chromosome-specific phage libraries with a synthetic poly(dC-dA). (dG-dT) cprobe. Over 100 repeat blocks were isolated. The inserts from the clones were amplified by primers T65798-T66047. Those clones where the repeat sequence has been determined are shown in T65704-797. This repeat sequence is from the marker clone Mdf5 which contains the repeat sequence as from the marker clone Mdf5 which contains the repeat sequence having the formula: (CT)7(CA)23.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Matches

Repeat sequence from polymorphic marker clone Mfd5.

Repeat sequence from polymorphic marker; primer; amplification; polymorphism; repeat sequence; genetic marker; primer; amplification; PCR; polymerase chain reaction; paternity; maternity; human; pedigree; linkage analysis; genetic disease; animal; plant; breeding; locus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CA repeats separated by no more than 3 consecutive non-repeat bases;
3) compound perfect repeats which are uninterrupted runs of CA separated by no more than 3 consecutive non-repeat bases from a run of at least 5 uninterrupted dinucleotide or longer repeats of a sequence other than (dC-dA)n.(dG-dT)n, or from at least 10 uninterrupted mononucleotides; and 4) imperfect compound repeats which are defined as for the perfect compound repeats which are defined as for the perfect rhis sequence is an example of a compound imperfect repeat sequence of structure: T(CT)_12GTT_T(C)_11T(CA)_14(AC)6.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      pr Detection of polymorphic genetic markers of the form
Detection of polymorphic genetic markers of the form
Pr (dC-dA)n(dG-dT)n - using novel nucleic acid mols. as primers
Claim 1; Column 13-14; 186pp; English.

The invention relates to the isolation of polymorphic repeat sequences
The invention relates to the isolation of polymorphic repeat sequences
C markers. Primers based on these sequences can be used to detect these
C repeats, especially for use in e.g paternity or maternity testing,
C human genetic analysis such as linkage analysis of genetic disease,
C containing the repeat sequences were isolated by hybridisation of
C chromosome-specific phage libraries with a synthetic poly(dC-dA).(dG-dT)
C probe. Over 100 repeat blocks were isolated. The inserts from the clones
C were amplified by primers T65798-T66047. Those clones where the repeat
C sequence has been determined are shown in T65704-797. This repeat
C sequence is from the marker clone Mdf120 which contains the repeat
C Sequence 50 BP; 20 A; 25 C; 0 G; 5 T;

Polymorphic bovine DNA markers - used in genetic identification, gene mapping, and selective breeding gene mapping, and selective breeding Table 7; Page 170; 517pp; English.

The sequence is that of a bovine microsatellite sequence obtd. by screening a library of bovine MboI DNA fragments of between 250 and 500 bp with an (AC)15 and a (TC)15 oligonucleotide probe. One out of 50 clones cross-hybridised. Assuming independent distribution of microsatellites and MboI sites, the frequency of (T6)n >9 microsatellites in the bovine genome is estimated at >100, 000. The sequence information for ca. 230 such bovine microsatellites is summarised in the specification and indexed herein (see below). The sequences upstream and downstream of the microsatellite sequence used to generate the required PCR primers for in vitro
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               )3/c

Cr he sequence is that of a bovine microsatellite sequence obtd. by

Cr screening a library of bovine MboI DNA fragments of between

Cr one out of 50 clones cross-hybridised. Assuming independent

Cr one out of 50 clones cross-hybridised. Assuming independent

Cr one out of 50 clones cross-hybridised. Assuming independent

Cr one out of 50 clones cross-hybridised. Assuming independent

Cr one out of 50 clones cross-hybridised. Assuming independent

Cr one out of 50 clones cross-hybridised. Assuming independent

Cr one out of 50 clones cross-hybridised.

Cr one out of 50 clones information for ca. 230 such bovine microsatellites

Cr is summarised in the specification and indexed herein (see below).

Cr is sequences upstream and downstream of the microsatellites

Cr is summarised in the specification and indexed herein (see below).

Cr amplification of the corresp. microsatellite (using the program of completing in the program of completing in cattle, to allow selective breading.

Cr or parentage testing, and in the genetic mapping of economic trait cr of contraits contraits esp. in cattle, to allow selective breading.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PT Polymorphic bowine DNA markers - used in genetic identification, PT gene mapping, and selective breeding
PS Table 7; Page 167; 517pp; English.

CC The sequence is that of a bovine microsatellite sequence obtd. by
CC Screening a library of bovine MboI DNA fragments of between
CC One out of 50 clones cross-hybridised. Assuming independent
CC One out of 50 clones cross-hybridised. Assuming independent
CC One out of 50 clones cross-hybridised. Assuming independent
CC (T6)n >9 microsatellites in the bovine genome is estimated at >100,
CC on the sequence information for ca. 230 such bovine microsatellites
CC is summarised in the specification and indexed herein (see below).
CC The sequences upstream and downstream of the microsatellite sequence
CC amplification of the corresp. microsatellite (using the program
CC OPTIFRIM). The microsatellites may be used to identify individuals,
CC for parentage testing, and in the genetic mapping of economic trait
CC loci, or genes involved the determinism of economically important
CC see also Q33501-34437.

Example 1; Page 45; 117pp; English.

This is the nucleotide sequence for the PCR primer used in the amplification of the Alu repeat sequence, which is used to demonstrate the processes described in the invention. It involves the creation and use of circular yeast artificial chromosome (YAC) to selectively clone specific nucleic acids from a background of mixed nucleic acids by introducing the vector(s) into E. coli cells. They can be used to rapidly isolate human DNA where only a part of the sequence of DNA is known. Using the methods large fragments of DNA can be easily cloned and analysed.

Example 2: Page 42: 82pp; English.

Competition experiments using the DNAseI protection assay showed that an oligonucleotide contg. 15 tandem ATT repeats was an effective competitor for binding of the HeLa factor. This oligo was used to prepare an oligonucleotide affinity column for purification of RIP60 from Chinese hamster cells. The protein recognises and binds to an (ATT)n motif in the dhfr gene ori. It can also bind to the yeast ARS1 domain B. See Q22753 and Q24811.

The STR can be used for treatment and diagnosis in and veterinary medicine, partic. for genetic characterisation mapping, linkage studies and analysis/diagnosis of acquired dialleles.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           CC synthetic polyester genes given in Q71801-02. These fragments were CC used in the production of the full length polyester gene in the plasmid CC pMAL-p2. This plasmid was used so that the polyester could be expressed CC in an E. coli cell free medium, as pMAL-p2 is recognised by E. coli CC ribozymes and contains the necessary initiator sequences and the CC template for the polyeptide leader. The resulting plasmid pMAL-2c CC contains the complete polyester coding sequence ligated in frame with CC the leader sequence. The expressed sequences represent synthetic CC genes which were used in the synthesis of polyesters derived from the CC amino acid analogues of an amino acid except pro. Of the three stop CC codons, UAA, UAG and UGA, one of these stop codons is reversed for the CC available for encoding the monomer units of the polyester. Lactate CC and glycolate are encoded by UAA and UAG, respectively. Initiation of translation always starts at an AUG codon. This is accomplished CC manner always starts at an AUG codon. This is accomplished CC instable for the polymer chain. The resulting polymer is treated CC first position of the polymer chain. The resulting polymer is treated CC with cyanogen bromide to remove the Met. Co-polymers produced in this CC manner may be used to produce suthres, staples, clibs, drug delivery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match 0.1

Example 1; Page 45; 67pp; English.

This sequence represents a fragment of the plasmid psporT Ic which contains the 5' fragment of the synthetic genes which encode polyesters, given in Q71801-02, under the control of the E. coli trpA transcription initiator and followed by FokI and HindIII restriction sites. A further fragment of the synthetic genes were ligated into psporT Ic to give plasmid psporT Id (see also Q71810-11), with the final fragment being inserted in a third round of ligation to give psporT Ie (see also Q71812).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         pSPORT-IC synthetic polyester gene 5' fragment and trpA initiator. CC length sequences given in Q71801-02 in an E. coli cell free medium. The CC length sequences given in Q71801-02 in an E. coli cell free medium. The CC expressed sequences represent synthetic genes which were used in the CC synthesis of polyesters derived from the a-amino acid analogues of an CC amino acid except pro. Of the three stop codons, UAA, UAG and UGA, one CC of these stop codons is reversed for the stop signal for the monomer CC units of the polyester. Lactate and glycolate are encoded by UAA and CC UAG, respectively. Initiation of translation always starts at an AUG codon, therefore the first lactate of the chain may be encoded by an AUG codon. This is accomplished through the use of a specially modified the tis incorporated in the first position of the polymer chain. The CC met is incorporated in the first position of the polymer chain. The cresulting polymer is treated with cyanogen bromide to remove the Met. CC cpolymers produced in this manner may be used to produce sutures, Staples, clips, drug delivery devices, pins and screws.

Sequence 103 Bp; 58 A; 7 C; 9 G; 29 T;
